Subject: Shakertown Corporation at Winlock

Date: December 13, 1974

On October 31, 1974 a survey of Shakertown Corporation was conducted to determine the extent of any waste water discharges to Olequa Creek.

A clean discharge at the main mill at the north end of town was sampled. It was apparently surface runoff water. Flow was approximately 10 to 15 gpm. No phenols were detected.

A bright pink, very small discharge of about 1/4 gpm was sampled at the smaller mill to the south. Phenols were 1.20 ppm.

Very little leachate was discharging to Olequa Creek. A problem during flood conditions might occur if the lagoons holding waste waters are overrun by the creek. Apparently the constituents in the lagoons are quite toxic judging by the dead trees around their perimeters.
